

Abstract

The **Vehicle Service Management System** is a web-based application developed using **Python and Django** to automate and simplify the operations of automobile service centers and workshops. Traditional vehicle servicing processes often rely on manual record-keeping, which can result in delays, misplaced records, and inefficient customer service. This system provides a centralized platform for managing vehicle service activities efficiently and accurately.

The application allows customers to register and schedule service appointments online by providing vehicle details and selecting the required services. Service advisors can create job cards, assign technicians, track service progress, and update repair details throughout the servicing process. The system maintains comprehensive records of customers, vehicles, service history, spare parts used, and billing information.

Administrators can manage customer data, technician details, inventory of spare parts, service charges, and generate invoices automatically. The system also provides dashboards and reports to monitor daily service activities, revenue, pending jobs, and inventory status. Customers can track the status of their vehicles, view previous service records, and receive notifications regarding service completion and upcoming maintenance schedules.

The **Vehicle Service Management System** improves operational efficiency, reduces paperwork, minimizes human errors, and enhances customer satisfaction by providing timely and transparent services. By digitizing the complete service workflow, the application ensures better resource management, accurate record maintenance, and effective communication between customers and service providers. This project is highly beneficial for automobile service centers, garages, authorized dealerships, and vehicle maintenance workshops seeking a reliable and user-friendly service management solution.
